

ERDC Dredging Operations Technical Support Program (DOTS)

U.S. ARMY CORPS OF ENGINEERS

BUILDING STRONG®

Response Summary:

Trained USACE New Orleans District (MVN) employees on operation of Beach-fx and G2CRM over a weeklong training session. The training consisted of hands-on training with MVN data. Training assisted users in operating multiple USACE tools, including Beach-fx, BMAP/RMAP, and SBEACH.

Period of Performance:

16-20 July 2023

Benefits of the Response to the USACE Dredging/Navigation Program:

Beach-fx allows the district to optimize beach nourishment placement. The model provides a method of cost benefit analysis of beach nourishments and optimizes the nourishment schedule with respect to overall placement costs. Optimization of nourishment intervals considers the morphology change, dredge production rates and morphology cost, and dredging blackout windows due to nesting seasons. These factors allow districts to optimize dredging schedules with respect to beach nourishment. Additionally, BMAP/RMAP allow users to analyze survey transects for a wide variety of beach projects, including nearshore placement. These skills will allow the MVN users to contribute to future beach nourishment projects. A site visit to Grand Isle was held to assist team in scoping of potential projects.

Deliverable:

Workshop was delivered on the week of July 16th to MVN employees. Workshop and site visit photo below.

Providing environmental and engineering technical support to the U.S. Army Corps of Engineers
Operations and Maintenance navigation and dredging missions
